PROFESSIONAL SUMMARY

Technical support specialist who combines 4 years of enterprise support experience with hands-on infrastructure skills gained from building and maintaining real production systems. Spent the past decade helping technical users troubleshoot AI tools, databases, APIs, and deployment issues through educational content that's reached 41,500+ YouTube subscribers. Known for solving complex problems, explaining technical concepts clearly, and thinking strategically about preventing issues rather than just fixing them. Comfortable with Python scripting, Docker, cloud platforms, and the kind of novel technical challenges that come with supporting AI researchers.

PROFESSIONAL EXPERIENCE

AI Educator & Technical Content Creator — Mike Murphy, LLC

2015 – Present | Naples, FL

- Built and maintained real production infrastructure including VPS servers running Docker containers, PostgreSQL databases with vector extensions, n8n automation workflows, and self-hosted LLM deployments—documenting the entire process through tutorials that help others do the same
- Help technical users (developers, AI enthusiasts, creators) troubleshoot complex problems daily via YouTube comments, email, and social media—everything from API authentication issues to database connection problems to Docker networking challenges
- Created 25+ in-depth tutorials on AI infrastructure topics: RAG systems, vector databases, LLM deployment, VPS security, API integrations, and workflow automation—focusing on the practical troubleshooting knowledge that's missing from official documentation
- Use Python and Bash scripting to automate repetitive tasks and build tools that solve recurring problems—the same mindset of "why does this keep happening and how can I prevent it?" that drives good IT support
- Became comfortable with cutting-edge AI tools (Claude, ChatGPT, Gemini APIs) by using them constantly, troubleshooting when things break, and staying current with new releases—often creating tutorials within days of a new tool launching
- Developed pattern recognition for common issues and created documentation that helps people solve problems themselves—reducing the need for one-on-one support while still being available when people get stuck

Senior Technical Account Manager — SimpleCast + SiriusXM

2018 – 2022 | Remote

- Provided technical support to 100+ enterprise clients using Intercom and Zendesk, troubleshooting issues with podcast hosting, distribution, analytics, and API integrations while consistently meeting SLA targets
- Worked directly with product and engineering teams via Asana, Jira, and Slack to resolve complex technical issues—providing clear reproduction steps and advocating for fixes that would prevent the same problem from affecting other clients

- Created support documentation and video tutorials that helped both clients and internal team members understand complicated platform features—scaling knowledge instead of answering the same questions repeatedly
- Stayed calm during high-pressure situations when enterprise clients had production issues—keeping everyone informed while coordinating with engineering to get things fixed quickly

Studio Manager — Heather Donlan Photography

2007 – 2016 | Naples, FL

- Managed all technical needs for a busy photography studio—WordPress hosting, Google Workspace administration, backup systems, network troubleshooting, and general IT problem-solving
- Learned technical skills through hands-on experimentation and self-directed learning—the same approach I still use when encountering new technologies
- Kept everything running smoothly by fixing problems quickly and proactively preventing issues before they impacted the business

TECHNICAL SKILLS

What I'm Comfortable With:

- **Cloud & Servers:** Google Cloud Platform basics, VPS hosting and management, SSH, basic networking (DNS, firewalls, VPNs)
- **Scripting & Automation:** Python for automation and scripting, Bash scripts, building workflows in n8n, API troubleshooting
- **Containers & Databases:** Docker (running containers, basic networking, troubleshooting), PostgreSQL administration, database connections and authentication
- **Operating Systems:** Linux (Ubuntu/Debian command line, package management, system monitoring), macOS troubleshooting
- **AI/ML Tools:** Working with LLM APIs (OpenAI, Claude, Gemini), deploying local models (Ollama), RAG systems, vector databases, troubleshooting AI tool integrations
- **Collaboration Tools:** Google Workspace, Slack, GitHub, WordPress, Intercom, Zendesk, Asana, Jira
- **Development Tools:** VS Code, Git basics, Postman for API testing, Streamlit for building simple apps

What I'm Still Learning:

- Advanced IAM and authentication systems (I understand the concepts but haven't administered enterprise-level systems)
- MDM platforms like Jamf or Intune (no hands-on experience)
- Kubernetes (I understand Docker but haven't worked with K8s orchestration)
- Compliance frameworks like SOC2 or ISO 27001 (familiar with the concepts but no direct experience)

How I Approach Problems:

- I don't just fix the immediate problem—I think about why it happened and how to prevent it from happening again
- I recognize patterns across multiple issues and look for systemic solutions

- I think through what might break before making changes, especially in production systems
- I document solutions clearly so others can learn from them
- I stay calm when things are broken and people are stressed
- I'm comfortable saying "I don't know, but I'll figure it out" and then actually figuring it out

THINGS I'VE ACTUALLY BUILT

Production VPS Infrastructure

Set up and maintain a production VPS running multiple Docker containers (Ollama for local LLMs, n8n for automation, PostgreSQL databases). Configured firewall rules, set up SSH properly, implemented backup strategies, and keep everything updated and secure. It's not enterprise-scale but it's real infrastructure that I'm responsible for keeping running.

RAG System with Vector Database

Built a RAG system that searches through my AI conversation history using PostgreSQL with the pgvector extension. Learned about embedding models, vector similarity search, database indexing, and API integration by actually building something that works. Troubleshooted all the common issues (authentication problems, dimension mismatches, connection pooling) by reading error logs and figuring it out.

Automation Workflows & RAG Pipelines

Actively building and experimenting with n8n workflows that orchestrate complex AI automation pipelines. Created RAG workflows that chain together API calls (OpenAI, Claude, Ollama), vector database queries, and data processing steps. Built automation using self-hosted Ollama models for tasks like content generation, semantic search, and document processing. These aren't simple scripts—they're multi-step orchestrations that handle authentication, error handling, and data transformation across different services.

Technical Documentation

Created 1,500+ tutorials and guides over 10 years, focusing on the troubleshooting knowledge that's hard to find in official docs. I'm good at explaining technical concepts clearly because I've had to do it thousands of times, and I know which parts people actually get stuck on.

EDUCATION

Masters in Law Administration

University of Denver School of Law | 2005 – 2007 | GPA: 3.98

B.A. English (Cum Laude)

University of Massachusetts-Amherst | 1988 – 1992 | GPA: 3.35
